Demo:Drivers How to Avoid a Car Accident in Arizona When you drive in Arizona, you're already in an accident-prone region. The problem is that accident rates are going up in the state. And now's the time to do something about it. In fact, the time to get a car accident insurance quote is NOW. While the risk of a car accident may be elevated, you can lower the odds with these simple tips. How to Avoid a Car Accident Take Your Time In Arizona, the speed limit is 55 mph, but in urban areas, that number is considerably lower. Watch Out for Turns Arizona drivers turn on a dime more often than drivers in other states. You can see this in the data from the Arizona Department of Transportation (ADOT). In 2010, there were 67.5 turn-related crashes per 100,000 residents. Compare that with New York, which saw just 21.6 per 100,000, and you'll see what we're talking about. (ADOT) Keep Out of the Lane of the Car in Front of You Cars are made to go fast, and sometimes you don't want to go fast. However, keep your vehicle to the right and stay out of the lane of traffic behind the car in front of you. (Just like with buses and trains, giving your car space helps it travel more safely.) Use High Beams If you're in a situation where you have to rely on your high beams, you could miss a turn or drive off the road. And that would be a bad thing. So, turn the beams on before you turn the wheel. Keep a Safe Distance The crash rates of drivers and passengers are extremely different. What that means is, if you're the driver of a vehicle, you're much more likely to be in an accident with an out-of-state driver. Keep a safe distance between your car and the car in front of you. Make a Safe Stop You're more likely to have an accident when you stop. For example, 66.2 percent of drivers involved in crashes didn't make a stop in 2010. Stop as close as you can to a traffic light or an intersection.Q: Handling background image changes with CSS I am looking for a way to work with background images. What i have: HTML: 82157476af
